PUBLIC RELEASE VIEW

Small by design. Patient-controlled by default.

A plain-language view of BastCare's system context, visit lifecycle, sharing controls, account deletion, and retained audit evidence.

01

On-device transcript

The original transcript stays protected on the iPhone. A masked copy is sent only to create or regenerate a summary; Bast keeps no transcript archive.

02

Explicit sharing

The patient chooses each summary and each CareTeam. Only confirmed members receive it. Sharing nothing is valid, and access can be revoked.

03

Evidence, not content

Limited audit and usage records support deletion evidence and billing transparency. They do not contain audio or transcript text.

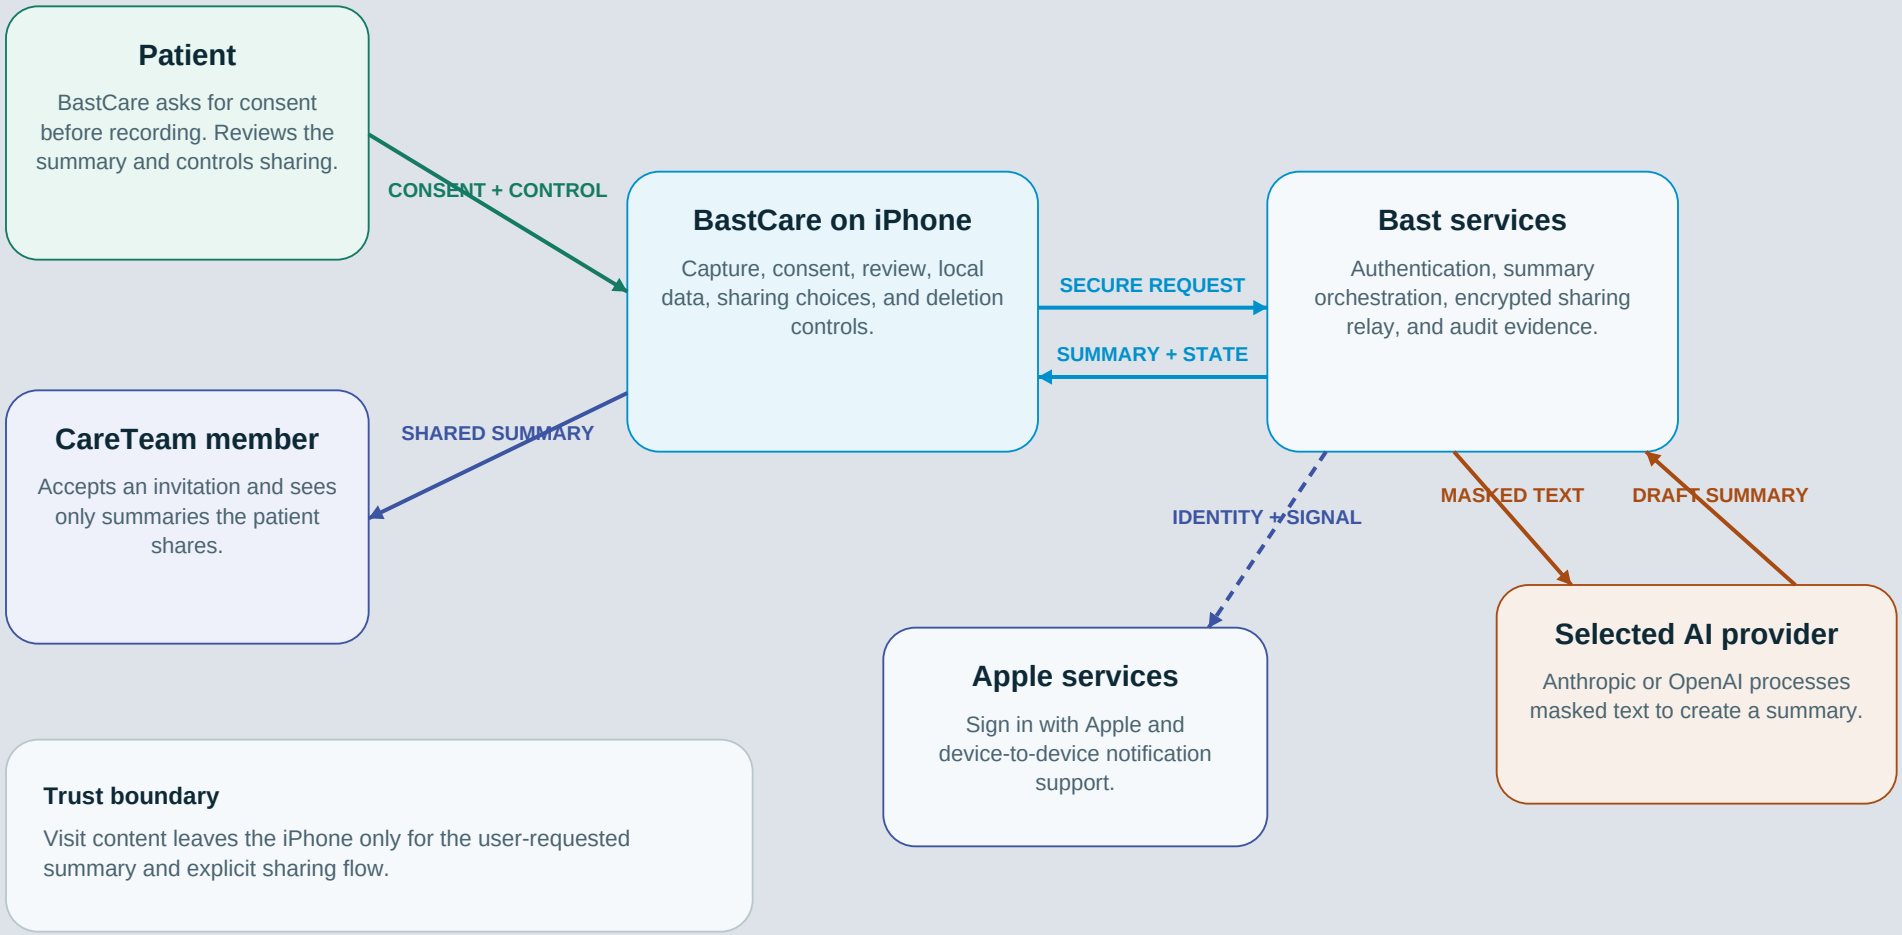
The design promise

BastCare helps a patient capture a visit, receive a plain-language summary, and choose whether to share it with trusted people. The transcript stays on the iPhone so the patient can view, download, or regenerate from it.

SYSTEM CONTEXT

Who participates - and where data crosses a boundary

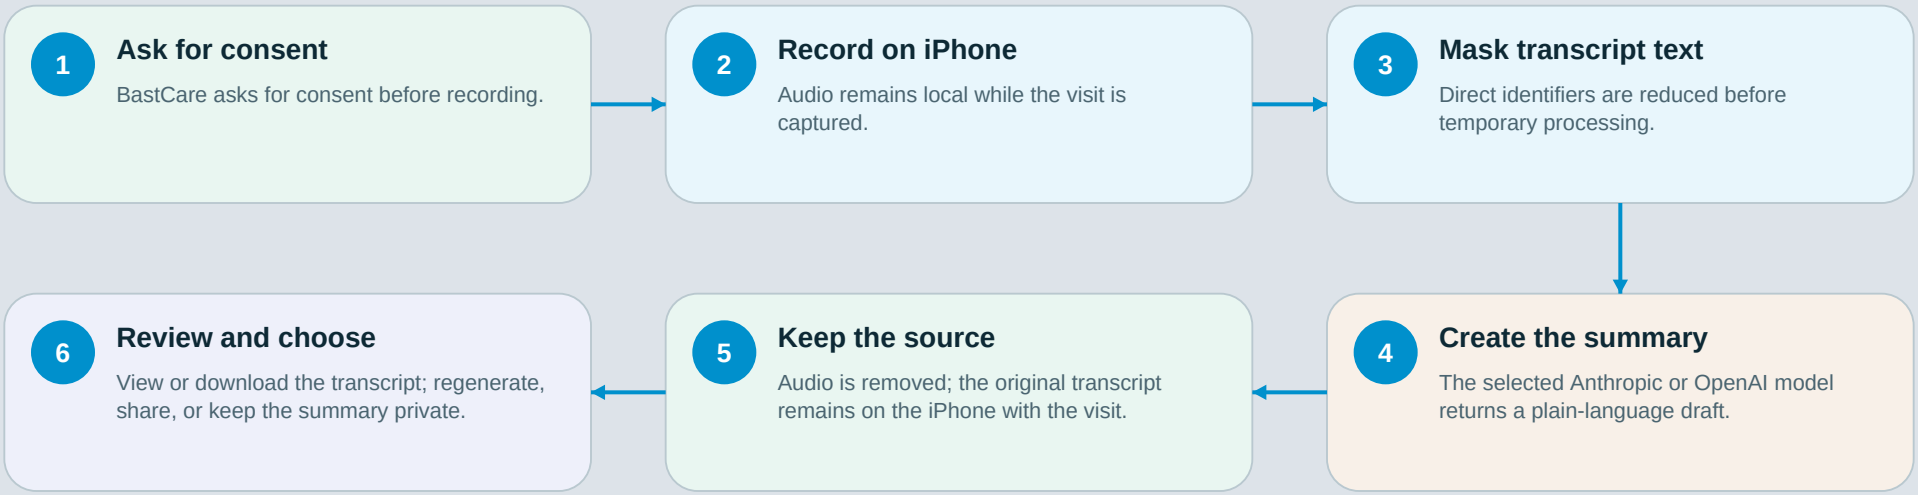
Arrows show purposeful exchanges. They do not imply that every component stores the data it handles.



VISIT LIFECYCLE

Ask for consent, then summarize

BastCare asks for consent before recording. Audio is temporary. The transcript stays protected on the iPhone.



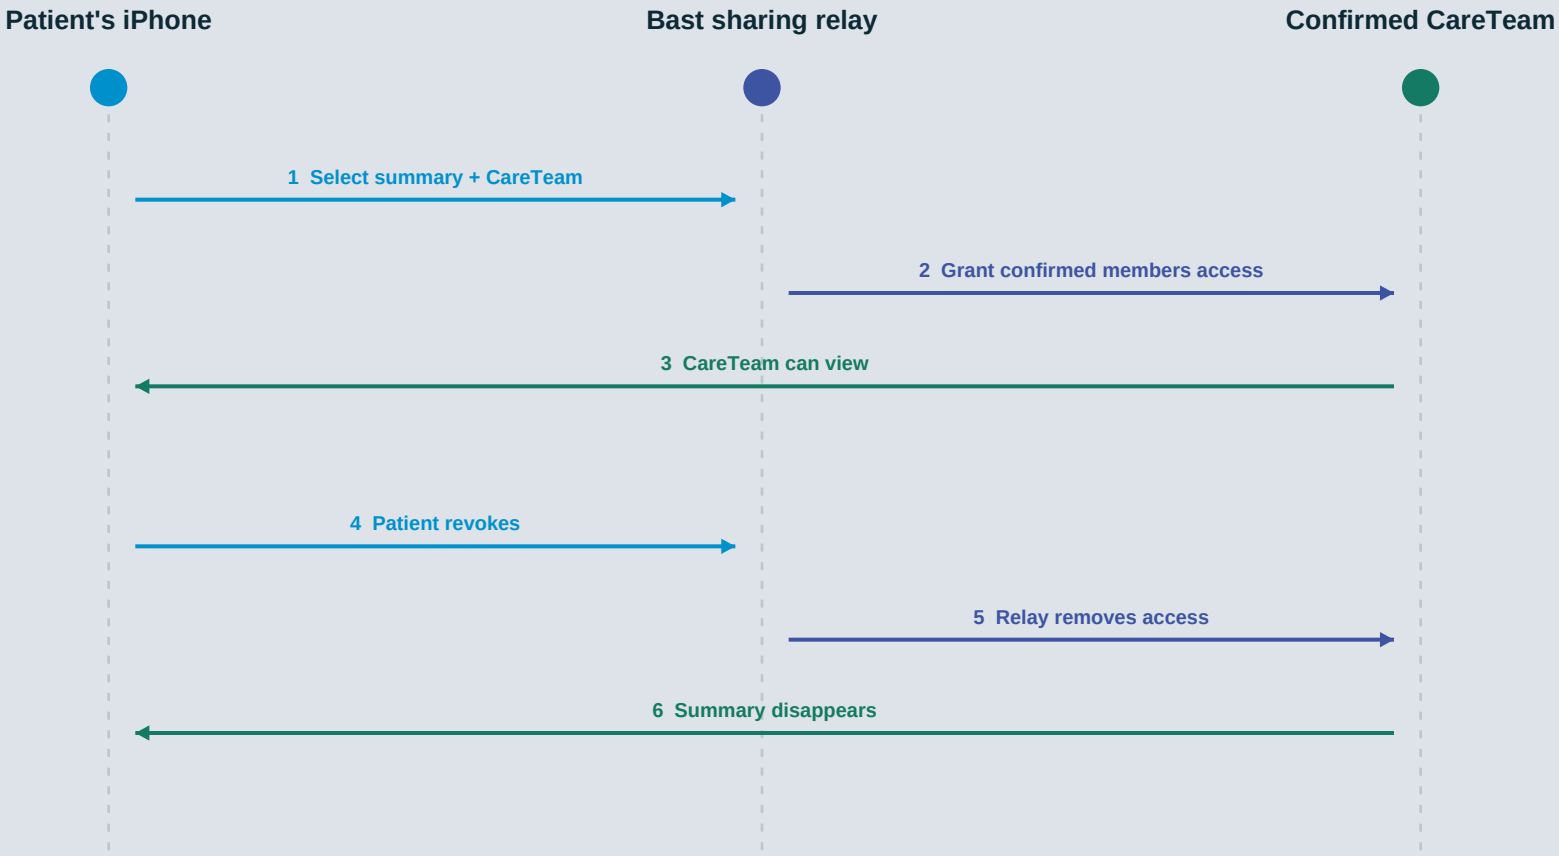
What remains

The original transcript and current summary remain protected on the patient's iPhone. Bast keeps no server transcript archive. Deleting the visit removes its transcript and summary.

SHARING AND REVOCATION

One patient choice, one scoped result

Sharing is summary-by-summary and CareTeam-by-CareTeam. Revocation follows the same clear path.



Control rule No blanket access. No automatic resharing. No penalty for sharing nothing.

ACCOUNT DELETION

Delete the account; preserve accountable evidence

The flow separates user data removal from the minimum records Bast needs to prove what happened.

1. **Confirm in BastCare**
   The user reviews the effects and confirms account deletion.
2. **Remove active account data**
   Identity links, access, shared summaries, invitations, device registrations, and local app data are removed.
3. **Confirm the outcome**
   BastCare reports success or a clear retry path; the action receives an audit reference.

After deletion

DELETED

User-facing account data

Account identity links, authentication access, CareTeam membership, invitations, shared content, device registrations, and local BastCare data.

RETAINED - LIMITED

Audit and usage evidence

Deletion event, outcome, timing, and minimized usage or token totals needed for security, billing transparency, legal duties, and aggregate operations. No audio or transcript text.

Retention is purpose-limited, access-controlled, and governed by Bast's documented retention schedule.

DESIGN COMMITMENTS

What the architecture is designed to protect

A release-ready summary for users, reviewers, partners, and future contributors.

C1

Consent

BastCare asks for consent before recording.

C2

Provenance

The summary identifies what came from the visit and what the patient added.

C3

Data minimization

Bast keeps no server audio or transcript archive; the transcript remains on the patient's iPhone.

C4

Patient control

Each CareTeam share is explicit, scoped, visible, and revocable.

C5

Account deletion

The app offers deletion without requiring support intervention.

C6

Accountability

Limited audit evidence records actions without retaining transcript content.

Plain-language architecture

BastCare asks for consent before recording. Audio is deleted after the summary is saved. The original transcript stays protected on the iPhone, where the patient can view or download it and use it to regenerate a summary. Bast does not save or log transcript text. Sharing remains explicit. Deleting a visit removes its transcript and summary.
